

INTRODUCTION

Restaurant Management project is designed using SQL as the Backend and Python as front end. SQL is a structured query language which facilitates the storage of databases in the form of tables. Python is one of the emerging programming languages which is widely used by many organizations for software development process. Thus with the help of these two softwares this project has been developed

A restaurant is a business that prepares and serves food and drinks to customers. This project is designed with the different menus to do the basic operations of a restaurant. The software can be used by restaurants to do their business in an easy and efficient way.

The project has three logins namely admin, user and others. Admin is being created to have overall control of managing the entire software except editing the feedback given by the customers. Users have rights to add/delete a food menu, add a branch, view the booking details. Others login is designated for customers. They can view the food menu, add a booking, add or delete the feedback for their orders.

Admin login includes the following sub menus

1. Food menu
2. Stock
3. Branches
4. Staff info
5. Gross
6. Booking
7. Feedback
8. Exit

The Users login include submenus like

1. Food menu
2. Branches
3. Booking
4. Exit

The others login include

1. Food menu
2. Booking
3. Feedback
4. Exit

The project is designed in such a way that if more than two operations are performed in the same login, then it will ask for password for security reasons.

Objectives

This project is designed with the following objectives

Primary objective:

1. To design a restaurant management system using SQL as backend and Python as front end.

Secondary objectives:

Based on the primary objective the following secondary objectives are framed

1. To design an Admin menu with functions like Food Menu maintenance, Stock maintenance, branches maintenance, staff info maintenance, Accounts maintenance, Booking details maintenance and feedback view.
2. To design user menu with functions like food menu maintenance, branches maintenance, and viewing the booking details.
3. To design others menu for customer to perform functions like viewing food menu, ordering food and giving feedback for orders

System requirements & Specifications

Front End (Python):

- Processors: Intel® Core™ i5 processor 4300M at 2.60 GHz or 2.59 GHz (1 socket, 2 cores, 2 threads per core), 8 GB of DRAM Intel® Xeon® processor E5-2698 v3 at 2.30 GHz (2 sockets, 16 cores each, 1 thread per core), 64 GB of DRAM Intel® Xeon Phi™ processor 7210 at 1.30 GHz (1 socket, 64 cores, 4 threads per core), 32 GB of DRAM, 16 GB of MCDRAM (flat mode enabled)
- Disk space: 2 to 3 GB
- Operating systems: Windows® 10, MacOS, and Linux*

Back End (SQL):

Processor - Minimum: 1 GHz (x86 processor) or 1.4 GHz (x64 processor) or 1.0 GHz (IA64 processor)

Recommended: 2 GHz or faster (dual-core or quad-core will be much faster)

Limitations: SQL Server Express supports 1 physical processor, 1 GB memory, and 10 GB storage.

Memory - Minimum: 4 GB RAM

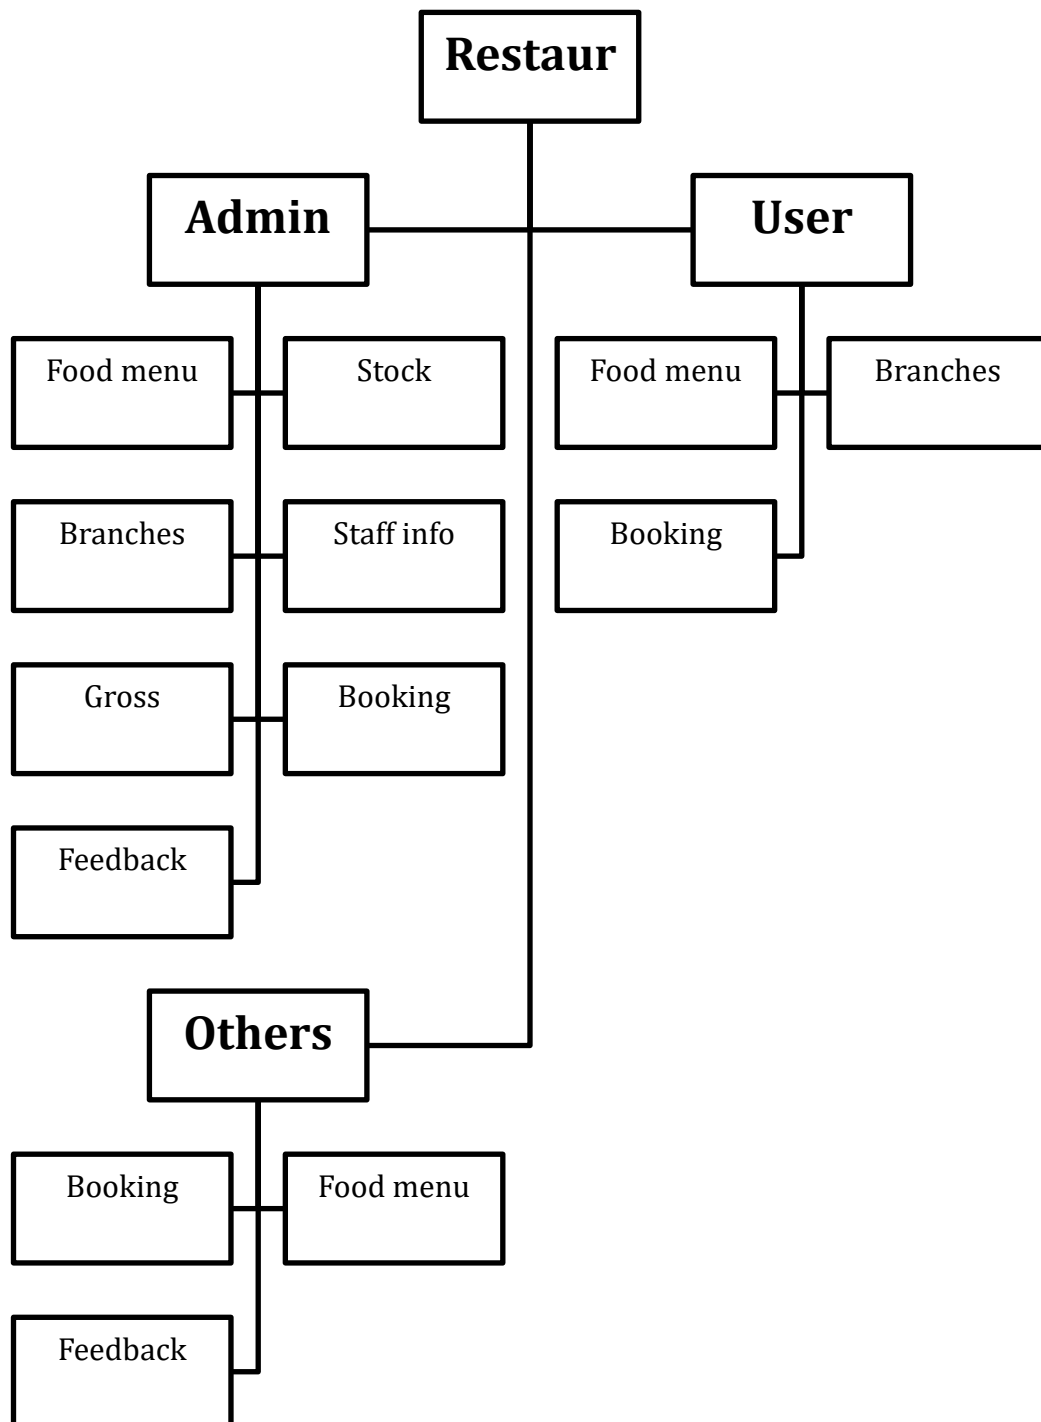

Recommended: 8 GB RAM or Greater (more RAM up to 32 GB, better performance)

SQL Version- Microsoft SQL Server 2014 Express is provided with Miracle Service.

Miracle Service SQL database is also compatible with: Microsoft SQL Server 2008 R2, Microsoft SQL Server 2012 R2 and SQL Express 2012 R2.

Available Disk Space Minimum: 100 GB Free Disk Space on C: Drive

Workflow

Code

```
import time
#establishing connectivity
import pymysql

L i m i t a t i o n s

Even though the project is designed with careful analysis, few limitations are there due to time constraints.

- Admins can set password for their login once, but password changing facilities are not included
- There is no facility of storing the login details of different users and others
- Anybody can login as others into the system. Admin don't have control of creating the customers login
- Table insertion and deletion commands are included but update and alter functions are not used.
- Related tables are not created.

C o n c l u s i o n

Thus this project is designed with the required sub menus and working of each and every menu is tested and corrections are made in the coding to make the required error corrections. The project can be used by any company which is doing restaurant business, to manage their food menus, staff details, order details, stock details, revenue details, branches details. Since the project is designed with SQL and Python, it is compatible with any operating systems like windows, Linux, Macintosh etc. This project can further be improved by introducing the option to select the databases by the admin, giving rights to the admin to create customers login. Related tables can also be created to further enhance the functioning of the software. Leftout facilities will be included in the updated version of the software. The new version will also include the Graphical User Interface (GUI).
